ABSTRACT:

In the beam guides is slidably fitted a crab, from which is
rotatably suspended
a hoist with a gripper or support mechanism. The hoist has
a crane fork with
lower, box-shaped traverse, which is coupled to a top,
fork-shaped orthogonally
protruding carrier. The carrier connection is via a
central, orthogonal,
vertically protruding support. On the traverse are secured
fork tines by
brackets, fitting round the traverse and matching its
cross-sectional shape.
The protruding, fork-shaped carrier is rotatably fitted on
the crab.
USE/ADVANTAGE - Easy handling by a single person, and
uniform load distribution
over the vehicle loading surface.
